No chance.

What are the chances of a coin landing on heads if we flip it four times?

The chance of getting ‘heads’ is about 90 percent. Have you read my little book, “What Caused my Noddles?” What are the chances of the universe coming to existence by chance? -There is no chance.

But, according to physicists, the universe was made out of cosmic fluctuations. What are cosmic fluctuations? The word just means moving like a wave. The non-Christian scientists argue that the first element created was hydrogen and then the Helium.

On the other hand, scientists have created a new form of light using rubidium, which is very rare on Earth. Can rubidium evolve into particles? - Not a chance. If we are speaking of the conventional light in the rainbow spectrum. The Bible declares that God created light in the beginning of Genesis. What is light made out of? Light is made out of photons. Photons have no mass or electric charge.

Scientists have proven electromagnetic fluctuations by placing two metal plates parallel to each other to create fluctuations. What are the chances of creating light by magnetic fluctuations? No chance.

Yet, secular scientists believe the whole universe is made of cosmic fluctuations. The secular argument is based on the fluctuation of very small (Planck) scale particles created at the Plank Epoch. Sir and Professor Hawking spoke of the evaporation inside a black hole, creating cosmic fluctuations. Does this have a chance? Not a chance.

What are the chances of cosmic fluctuations creating the universe by chance? No chance. Chance does not exist. How can we get head or tails with out a quarter?

Does chance exists within a number of parameters? Chance is nothing if it starts with nothing.

To get a chance at head or tail, you need a quarter. Without a quarter, there is no chance of getting heads or tails. There are times when you might have the parameters, but still have an impossible chance of getting something. Have you seen “Divtiwian Man” by Leonardo Da Vinci? The drawing shows the mathematical impossibility of “squaring a circle," which is impossible because of the number pi. What about the chances of solving the “Abel impossible theorem," which deals with polynomials? No chance. With certain parameters, we can have a chance right? chance is no chance.

In history, the Romans had very little chance (four percent) of defeating the British in (65 AD), but against all odds, they defeated the queen.

In the battle of Agincourt, the protestants had a two percent chance of defeating the Catholics, but they did.

In the battle of Eger the Christians had a one percent chance of defeating the Muslims (Ottomans), yet they did.

What is a chance? Chance is nothing. When we think of chance, we confuse it with the odds. What are the chances of one million soldiers against no one or no person? One million soldiers have the parameters to fight, yet why would they fight against no person? No chance. Can nothing fight nothing?

According to those who believe in the eternity of space, cosmic fluctuations have always existed, and later they morphed into tiny particles. This is like believing in the “Stone Soup” myth without a stone or a pot. Chance does not cause inflation or cosmic fluctuations. Only God can create with the power of his word.

“ Psalm 33:6 proclaims that God created through the Spirit: “By the word of the Lord the heavens were made, and all their hosts by the power of his mouth.”
